Straight pipe connector construction

Straight pipe connector break-down

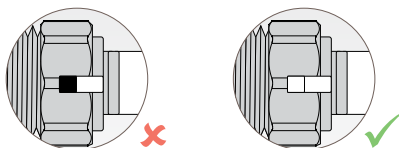

PRODUCT OVERVIEW

The complete pipe repair kit comprises of three individual components - two pipe couplings and one straight male-male fitting. These repair kits are available for 12mm, 15mm, 16mm and 17mm pipework. The design incorporates an O-ring sealing face to the straight connector. The split O-ring has a grooved inner face for gripping and holding the pipe, the split also ensures that over tightening can not take place.

After the connection has been made the system must be re-pressurized and signed off using the normal pressure test procedure.

Inspection chamber

Use the 'inspection chamber' to check that the pipe is fully inserted into the connector (see below).
